ABSTRACT OF THE DISCLOSURE

A fluid dispenser 10 with a replaceable receptacle 11 containing fluid 47 positioned within a housing 12. An inlet tube 42 and an outlet tube 43 are connected to a pump assembly 15 for drawing fluid from the receptacle and moving the fluid through a nozzle 80 having ~~an~~ outlet fluid discharge aperture 41. The nozzle is secured to a hand actuatable cover 13 which is depressable to operate the pump. The pump is mounted upon a retainer 14 structure which is connectable to the housing. When the receptacle becomes empty, the retainer may be disengaged from the housing, and the retainer and pump are then lifted away as one unit from the housing. The empty receptacle may then be replaced with a full one, and in reverse order, the dispenser may be reassembled.
